                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to methods and compositions useful for CC detecting mutations which cause Familial Dysautonomia (FD, Riley-Day CC syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIN CC 223900]. It was found that mutations in the IKBKAP gene (see AB680565) CC are associated with FD. The mutation associated with the major haplotype of FD, FD1 mutation, is a base pair (bp) mutation, where the thymine cc mucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced with a cytosine. This results in skipping of exon 20 in the mRNA from FD patients, although they continue to express varying levels of wild-type message in a tissue-specific manner. The mutation associated with the minor haplotype, FD2 mutation, is a bp mutation, where the guanine nucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine. This bp mutation causes an arginine to proline missense mutation (R696P) in the IKBKAP protein, which is predicted to disrupt a potential for identifying a subject with FD and for rapid carrier screening. The IKBKAP pene contains 37 exons and maps to chromosome 9311. Note; the present cc sequence was not shown in the specification, but was derived from the kxx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The present invention relates to methods and compositions useful for CC detecting mutations which cause Familial Dysautonomia (FD, Riley-Day Syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIM CC 233900]. It was found that mutations in the IKBKAP gene (see AB080565) [CC of FD, FD] mutation, is a base pair (bp) mutation, where the thymine CC of FD, FD] mutation, is a base pair (bp) mutation, where the thymine CC nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced CC with a cytosine. This results in skipping of exon 20 in the mRNA from FD CC patients, although they continue to express varying levels of wild-type CC message in a tissue-specific manner. The mutation associated with the CC minor haplotype, FD2 mutation, is a bp mutation, where the guanine CC micleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine. This bp mutation causes an arginine to proline missense mutation (R696P) [CC in the IKBKAP protein, which is predicted to disrupt a potential CC phosphorylation site. The IKBKAP mucleic acid sequences are useful for CC identifying a subject with FD and for rapid carrier screening. The IKBKAP gene contains 37 exons and maps to chromosome 9q11. Note: the present CC human wild-type IKBKAP sequence given in Fig 6
                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New IXBKAP genes with mutations, useful for identifying a subject with familial dysautonomia (FD), or for rapid carrier screening in the Ashkenari jewish population, e.g. screening presymptomatic homozygotes or

The present invention relates to methods and compositions useful for detecting mutations which cause Familial Dysautonomia (FD, Riley-Day Syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIM C2 23900]. It was found that mutations in the IKBKAP gene (see ABQ80565) CC are associated with FD. The mutation associated with the major haplotype C2 of FD, FD1 mutation, is a base pair (bp) mutation, where the thymine C3 nucleotide located at bp 6 of introm 20 in the IKBKAP gene is replaced C4 with a cytosine. This results in skipping of exon 20 in the mRNA from FD C5 patients, although they continue to express varying levels of wild-type C6 message in a tissue-specific manner. The mutation associated with the C7 mucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine. C6 minor haplotype, FD2 mutation, is a bp mutation, where the guanine C7 mucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine. C7 in the IKBKAP protein, which is predicted to disrupt a potential C7 in the IKBKAP protein, which is predicted to disrupt a potential C7 in the IKBKAP protein, which is predicted to disrupt a potential C7 in the IKBKAP protein, which is predicted to disrupt a potential C7 in the IKBKAP protein, which is predicted to disrupt a potential C7 in the IKBKAP protein, which is predicted to disrupt a potential C7 in the IKBKAP sequence was not shown in the specification, but was derived from the S7 km with the S7 km wi

Claim 1; Fig 6; 109pp; English.

The present invention relates to methods and compositions useful for detecting mutations which cause Familial Dysautonomia (FD, Riley-Day Syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIM 23900]. It was found that mutations in the IXBKAP gene (the present Sequence) are associated with FD. The mutation associated with the major chaplotype of FD, FD1 mutation, is a base pair (bp) mutation, where the thymine nucleotide located at bp 6 of intron 20 in the IXBKAP gene is creplaced with a cytosine. This results in skipping of exon 20 in the malor creme FD patients, although they continue to express varying levels of condid-type message in a tissue-specific manner. The mutation associated with the minor haplotype, FD2 mutation, is a bp mutation where the cytosine. This bp mutation causes an arginine to proline missense contation. [R696P) in the IXBKAP protein, which is predicted to disrupt a potential phosphorylation site. The IXBKAP nucleic acid sequences are useful for identifying a subject with FD and for rapid carrier screening. The IXBKAP gene contains 37 exons and maps to chromosome 9q31

                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL18176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57377-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABL57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention relates to compositions and methods for the detection, diagnosis and therapy of haematological malignancies. The present sequence is the coding Sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen(s) in a sample obtained from the patient (an increased level of the polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using the present invention are chronic lymphocytic leukaemia, lymphoma, follicular lymphoma, Hodgkin's lymphoma, non-Hodgkin's lymphoma and T/B cell non-Hodgkin's lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             28-APR-2000;

                                        The present invention relates to compositions and methods for the detection, diagnosis and therapy of haematological malignancies. The present sequence is the coding sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen(s) in a sample obtained from the patient (an increased level of the polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using the present invention are chronic lymphocytic leukaemia, lymphoma, follicular lymphoma, Hodgkin's lymphoma, non-Hodgkin's lymphoma and T/B cell non-Hodgkin's lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; cytostatic; vascular; gene therapy; vaccine; lymphoma; haematological malignancy; antigen; chronic lymphocytic leuka follicular lymphoma; Hodgkin's lymphoma; non-Hodgkin's lympho
                                                                                                                                                                                                                                                                                                                                                                                  Compositions and methods for the detection of hematological malignancies, e.g. chronic lymphocytic leukemia, lymphoma, follicular lymphoma and Hodgkin's and T/B cell non-Hodgkin's lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human haematological

                                                                                                                                             The present invention relates to a method (M1) for determining the subtype of leukaemia cells and whether a patient sample contains leukaemia cells. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                             Determining the subtype of leukemia cells and whether a patient sample contains leukemia cells or other cells, useful for treating leukemia, comprises determining the expression profile of a group of markers in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; Gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   26-FEB-2004

                                                                                                                                                                                                                                                                                                                                         leukaemia cells. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.

CC expression, comprising any of the 27,400 fully defined nucleotide
CC expression, comprising any of the 6888 amino acid sequences
CC fully defined in the specification, or their complements or fragments, and
CC encoding at least 8 amino acids of any of the 6888 amino acid sequences
CC fully defined in the specification. The probe is a single exon probe that
CC probes of the human cells or tissues. Also included are a spatially-
CC addressable set of single exon nucleic acid probes for measuring human
CC gene expression (comprising a plurality of single exon nucleic acid
CC probes cited above, where each of the plurality of probes is separately
CC and addressably isolatable or amplifiable from the plurality), a single
CC contiguous amino acids of any of the above-mentioned amino acid
CC sequences (optionally with conservative amino acid substitutions), an
isolated antibody that binds specifically to a peptide cited above,
CC methods of selling and/or licensing single exon probes or microarrays to
CC measuring human gene expression data by subscription, and a computer-readable
CC storage medium which contains a database having a plurality of providing
CC human gene expression data by subscription, and a computer-readable
CC storage medium which contains a database having a plurality of records
CC (each record including data on the expression of a single exon probe
CC etied above. The probe methods and apparatus are useful in gene

                                                                                                                                                                                                                                                      ce be amplified, assay comprising contracting a test compound with the CC protein, and determining whether the test compound with the CC and a Streptococcus pneumoniae bacterium, where one or more genes CC encoding the protein has been rendered inactive. The proteins, nucleic caid molecules, antibody and compositions are useful as medicaments for CC treating or preventing a disease or infection due to streptococcus bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otitis CC media or ear infection. They are also useful in developing vaccines, CC diagnostics and antibiotics. The methods are useful for identifying CC immunodominant proteins. The present sequence is one of the 2489 CC identified coding region from the genomic sequence. Note: The sequence data for this patent did not form part of the printed specification, but C was obtained in electronic format directly from WIPO at C ttp.wipo.int/pub/published_pct_sequences. (Updated on 27-OCT-2003 to C standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a protein comprising or having at least 50% condentity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, compressed from 2469 of 2489 identified DNA coding regions from the compressed from 2469 of 2489 identified DNA coding regions from the compression included are an antibody which binds one of the proteins, comparing a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 8-100 of a sequence not defined in the specification, for amplifying a target sequence contained within a Streptococcus nucleic acid sequence, where the first primer is substantially complementary to the target sequence cand the second primer is substantially complementary to the complement of the target sequence, and where the parts of the primers having substantial complementary to the complement of the target sequence to the angel complementary to the complement of the target sequence to the angel complementary to the complement of the target sequence to the angel complementary to the complement of the second primer is substantially complementary to the complement of the second primer is substantially complementary to the complement of the second primer is substantially complement of the target sequence to the angel complement of the complement of the second primer is substantially complement of the target sequence to the angel complement of the complement of the second primer is substantially complement of the target sequence to the second primer is substantially complement of the target sequence to the second primer is substantially complement of the target sequence to the second primer is substantially complement of the target sequence to the second primer is substantially complement of the target sequence to the second primer is substantially complement and the second primer is substantially comp
                                                                                                                              Query Match

                                                                                                                                                    The invention relates to new Proteus mirabilis polypeptides and polypeptides. The invention also relates to antibodies against the polypeptides, methods for producing the polypeptides, a method of generating vaccines for immunising an individual against P. mirabilis, a method for evaluating a compound for the ability to bind a P. mirabilis polypeptide and a method for screening test compounds for anti-bacterial activity. The polypeptides and polynuclaotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial vaccines, as targets for antibacterial drugs or as bio-control agents for plants. This sequence represents a Proteus mirabilis polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bacterial polynucleotide #585

The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents DNA encoding an A. baumannii

                                                                                                                                                                   The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, luvenile chronic arthritis, systemic sclerosis, Sjogren's syndrome, vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocycopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the
                                                                                                                          central or peripheral nervous system, demyelinating polyneuropathy, Guillain-Barre syndrome and chronic inflammatory demyelinating polyneuropathy. This sequence represents a human PRO polynucleotide
                                                                                                                                                                                                                                                                                                                                               Novel PRO polypeptide e.g., PRO69614, PRO71106, or PRO86388 useful for treating an immune related disorder such as systemic lupus crythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis or

                                                                                                                                                                                                                                                                              The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogren's syndrome, vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating polyneuropathy, Guillain-Barre syndrome and chronic inflammatory demyelinating polyneuropathy. This sequence represents a human PRO polynucleotide of

The method comprises determining the expression prof a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, for the preparation of a medicament for treating leukaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for predicting a toxic effect CC of a compound. The method comprises preparing a gene expression profile CC of a tissue or cell sample exposed to the compound, and comparing the CC gene expression profile to a database comprising SEQ ID 1-4925, where CC me method is useful for predicting at least one toxic effect of a compound, predicting hepatotoxicity or the progression of a toxic response, and compound a toxic response, predicting the cellular pathways that a CC compound modulates in a cell, and identifying an agent that modulates at least one activity of a protein. The method and compositions of the cC compound modulates in a cell, and identifying an agent that modulates at least one activity of a protein. The method and compositions of the cC compound expression, are useful in identifying toxicity markers in CC differential expression, are useful in identifying toxicity markers in CC specification, but was obtained in electronic format directly from WIPO cast firm with only the pathways obtained in electronic format directly from WIPO cast firm with the potential contraction of the printed contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The invention relates to a novel purified or isolated Cryptococcus neoformans nucleic acid molecule comprising a sequence encoding a polypeptide comprising a sequence not given in the specification. A polypucleotide of the invention has fungicide activity, and may have use in gene therapy. The nucleic acid is useful for preparing a composition for treating an infection caused by Cryptococcus neoforms

                                                                                                                                                                                                                       The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (AAV52134 to AAV52524) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID NO:1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 to 391 (AAV52134 to AAV52524) are genomic fragments from Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic NNA library mainspace.
          by a process comprising: (a) screening a genomic DNA library using as a probe a target sequence defined by any of the sequences in SEQ ID No:1 to 391, identifying members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating mRNA, DNA or cDNA produced from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification primers derived from the fragment of the S. pneumoniae genome to prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the S. pneumoniae genome of commercial importance, or expression modulating fragments of the S. pneumoniae genome of the S. pneumoniae genome. Products from the present invention can be used in pneumoniae genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Computer-readable medium with recorded Streptococcus pneumoniae polynucleotide sequences - useful in diagnostic kits and assays, and pharmaceutical compositions and vaccines for Streptococcus pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Kunsch CA, C

The method of the invention has cycostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

```

New polynucleotides derived from human prostate, immune response to prevent or treat cancer.

for modulating

The invention relates to an isolated polynucleotide 1477 sequences or its fragment, degenerate variant, complement. The polynucleotides and gene products as or diagnosing tumour or cancer (e.g. prostate cancer)

SEQ ID NO 896; 186pp + Sequence Listing;

isolated polynucleotide comprising

English

te variant, antisense or products are useful for treating state cancer, breast cancer, lung

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to novel isolated polynucleotides of human origin, comparticularly isolated from the human prostate. Specifically, it refers to compare the diagnostics and therapeutics comprising these novel human compared to polynucleotides, and includes the derived probes, antisense compositives, antisense such as concer, and hence they are important in the drug discovery process. The concer, and hence they are important in the drug discovery process. The concer, and hence they are important in the drug discovery process. The concern invention describes these polynucleotides and encoded compressions a exhibiting cytostatic activity, and through gene therapy cand, or vaccines they can be used to modulate the immune response for the prevention or treatment of cancer. This polynucleotide sequence is a compositive that the invention and compositive in the treatment of cancer, used in an compositive composition but are provided on the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
The invention relates to a novel isolated polypeptide from Penaeus monodon, an active fragment of the polypeptide, or a peptide with substantial sequence identity to the polypeptide, which serves to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cancer or medullary carcinoma) in a subject (e.g. cattle, dogs, cats, rabbits, horse or human). The polynucleotides and polypeptides are also useful as vaccines for treating or preventing these diseases. The polynucleotides are useful for gene therapy. The present sequence is that of one of a group of polynucleotides (ABQ887.45-ABQ90015) disclosed electronically as sequences of the invention. However only 1271 polynucleotide sequences are given, whereas 1477 polynucleotides and 91 proteins are claimed. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                       Claim 9;
                                                                                                                                                                                                      New peptides from Penaeus monodon, penaeid prawns, or for screening in
                                                                                                                                                                                                                                                                                   P-PSDB;

The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as AcH2789-AcH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for generic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antibodies specific for it. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        spawning in penaeid prawns. The protein of the invention has contraceptive and antiinfertility activity. The invention may have a use in gene therapy. The protein is useful for inhibiting spawning in penaeid prawns. This peptide is also useful for screening inhibitors of RIH. The antibody or RNAi is useful as an antagonist of a reproductive inhibiting hormone, and is useful for inducing spawning in Crustacea. The present sequence encodes the P. monodon putative reproductive inhibiting hormone (RIH), also referred to as PmSGPVI or SGPVI
                                                                                                                                                                                                                                                                                                New polynucleotide sequences obtained from various cDNA libraries, use as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; ss; sequencing by hybridisation; SBH; expressed sequence tag; EST; genome mapping; biodiversity; genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             is one of the 38043 isolated cDNA/EST sequences. Note for this patent did not form part of the printed specobtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=20030073623
                                                                                                                                                                                                                           The invention relates to 50 novel ESTs (expressed sequence tags; ABZ73 -ABZ73112) obtained from a rice leaf cDNA library. The invention also relates to a biochip comprising these ESTs. The biochip of the inventical can be used in a variety of agricultural applications. It can be used the cloning of genes which confer useful characteristics in crop specito predict hybrid vigour (heterosis) at an early stage, in the detection for transgenic agricultural produce, in screening for novel herbicides pesticides and in disease diagnosis. The biochip may also be used in medical research. The present sequence represents a rice leaf EST of the sequence represents a rice le
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rice; leaf; EST; expressed sequence tag; plant; biochip; DNA array cloning; detection; heterosis; hybrid vigour; transgene detection; herbicide screening; pesticide screening; disease diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABA60404 standard; DNA; 542
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human

                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 542 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                       WO200157274-A2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Human genome-derived single exon nucleic gene expression in human bone marrow.

acid

probes useful for analyzing

Example 4;

SEQ ID NO

9127; 658pp +

Sequence Listing; English

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancer such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention

                                                                                                                                            The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; brain expressed

                                                                                                                                                                                                                                                        The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nuclectide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABS25011-ABS51005 represent human liver single exon nucleic acid probes of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, single exon nucleic acid probe; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia; hypercholesterolaemia; coronary heart disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABS34344 standard; DNA; 542
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         09-AUG-2001.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          25-FEB-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ABS34344;

The protein of the invention has contraceptive and antiinfertility activity. The invention may have a use in gene therapy. The protein is useful for inhibiting spawning in penaeid prawns. This peptide is also useful for screening inhibitors of RIH. The antibody or RNAi is useful fas an antagonist of a reproductive inhibiting hormone, and is useful for inducing spawning in Crustacea. The present sequence encodes the P. monodon putative reproductive inhibiting hormone (RIH), also referred to as PmSGPVI or SGPVI
sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging
                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAS77840 standard; cDNA;

(I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at
encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular

                                                                     The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Staphylococcus aureus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Prokaryotic essential gene

CC proliferation or the activity of a gene in an operon required for CC proliferation; (7) identifying a compound that influences the activity of CC the gene product or that has an activity against a biological pathway CC required for proliferation, or that inhibits cellular proliferation; (8) CC identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies CC or a gene on which the test compound that inhibits proliferation of an CC compound's activity; (11) a culture comprising strains in which the gene CC product is overexpressed or underexpressed; (12) determining the extent CC strains; or (13) identifying is present in a culture or collection of CC strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required CC drug discovery programs, or for screening homologous nucleic acids required CC drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, CC prokaryotic essential genes. Note: The present sequence is one of the target CC prokaryotic essential genes. Note: The present sequence is one of the target CC prokaryotic essential genes. Note: The present sequence data for this patent did CC electronic format directly from WIPO at CC electronic format directly from WIPO at CC electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              derived from a variety of human tissues. The invention also provides a method for producing proteins from these polynucleotide sequences. The proteins are useful for identifying compounds that modulate their activity and production, and the cell is also useful for identifying compounds that modulate expression of the polynucleotide sequences of the invention are useful for treating diseases such as hyperproliferative disorders (e.g. cancer), immune deficiency disorders (e.g. cancer) autoimmune disorders (e.g. multiple sclerosis) blood disorders (e.g. thrombocytopaenia), inflammatory disorders (e.g. arthritis) and infectious disorders (e.g. hepatitis). The polynucleotide sequences of the invention are also useful in gene therapy. AAS62214-AAS62838
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Staphylococcus aureus DNA for cellular proliferation protein #393.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAS51976;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acid sequence is also useful to screen for homologous of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in
                                                                                                   The invention relates to novel genes and encoded proteins from Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Staphylococcus aureus preventing Staphylococcal S. aureus, e.g. sepsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        did not form part of the printed specification, but electronic format directly from WIPO at

                                                                       The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, cc themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, cc coli, Staphylococcus and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify croteins used in proliferation, to express these proteins. The proteins can be used to organize of binding to the expressed proteins. The proteins can be used to ocreen compounds in rational drug discovery programmes. The contisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety cof organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent clid not form part of the printed specification, but was obtained in celectronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ś
The invention relates to an isolated nucleic acid comprising any one of CC the 6213 antisense sequences given in the specification where expression CC of the nucleic acid inhibits proliferation of a cell. Also included are: CC (1) a vector comprising a promoter operably linked to the nucleic acid CC encoding a polypeptide whose expression is inhibited by the antisense CC nucleic acid; (2) a host cell containing the vector; (3) an isolated CC polypeptide or its fragment whose expression is inhibited by the antisense CC antisense nucleic acid; (4) an antibody capable of specifically binding CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular CC proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway CC required for proliferation, or that inhibits cellular proliferation; (8) clientifying a gene required for cellular proliferation or the best compound that inhibits proliferation of an organism acts; (9) manufacturing an antiblottic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent CC to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the extent CC identifying proteins or screening for homologous nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating call signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL3051), expressed DNA sequences (ABLIG176) and the encoded proteins (ABB57377-ABB72072). The sequence data for this patent did not form part of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
